What microstructural parameter can explain the observed change in white matter hyperintensities?

Standard Model

Isotropic

Intra-axonal

Extra-axonal

Parameter	Description
s_{iso}	Signal fraction for isotropic diffusion
s_{in}	Signal fraction of intra-cellular water
s_{ex}	Signal fraction of isotropic water
ODI	Fiber Orientation dispersion index
d_{iso}	Isotropic diffusivity
$d_{a_{in}}$	Intra axonal parallel diffusivity
$d_{a_{ex}}$	Extra axonal parallel diffusivity
τ	Extra axonal diffusivity ratio (tortuosity)

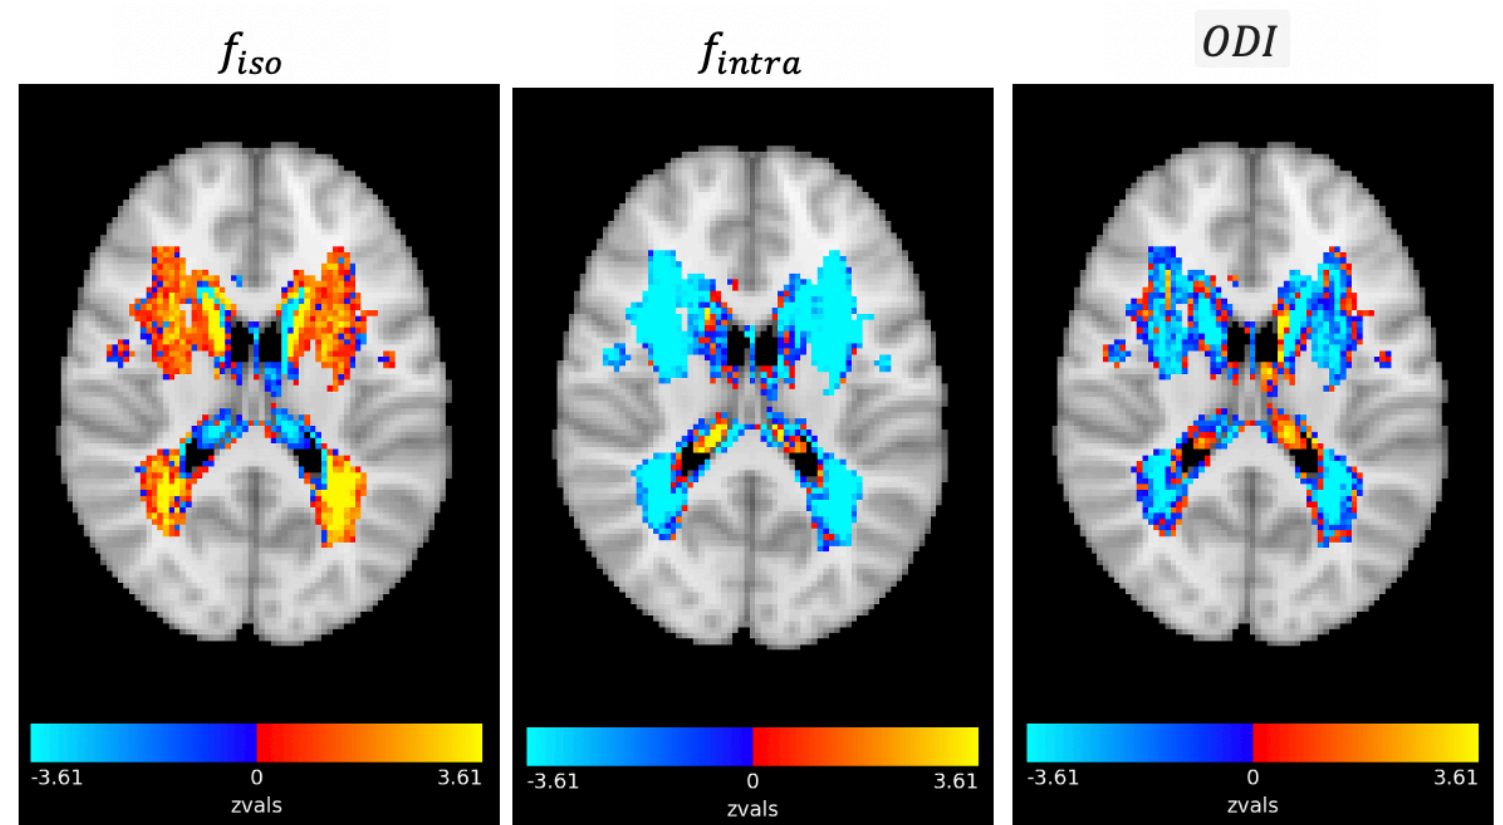

Fixed

Zhang, Hui, et al. "**NODDI**: practical in vivo neurite orientation dispersion and density imaging of the human brain." *Neuroimage* 61.4 (2012): 1000-1016.

Results from NODDI

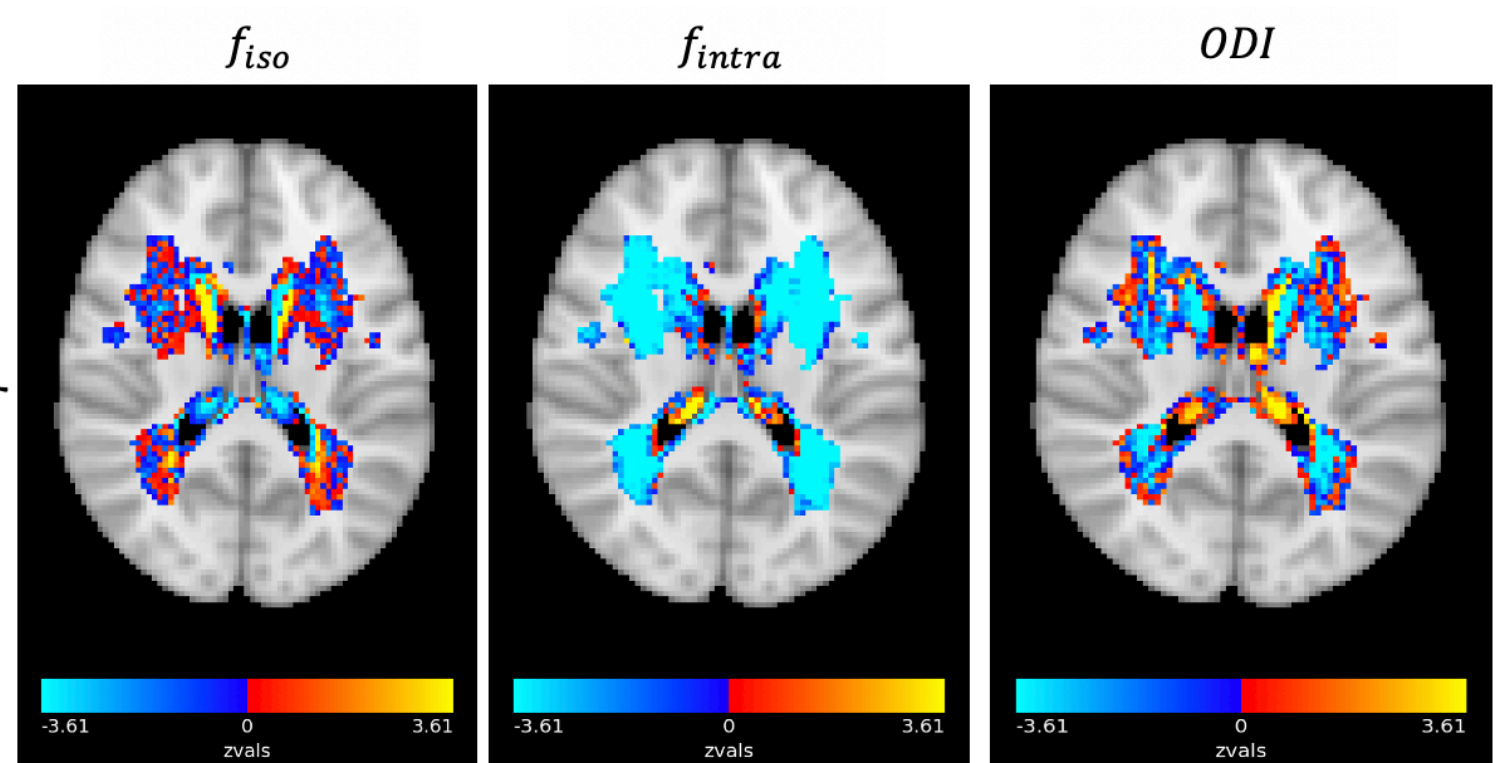

1. Free water has increased.
2. Ratio of inside to outside cellular space is decreased.
3. Fibres are less dispersed in the majority of voxels.

$$D = 1.7 \frac{ms}{\mu m^2}$$

1. Free water has decreased.
2. Ratio of inside to outside cellular space is decreased.
3. Fibres are more dispersed in some voxels.

$$D = 2.5 \frac{ms}{\mu m^2}$$

Can we avoid parameter fitting and still infer the change?

Simpler question:

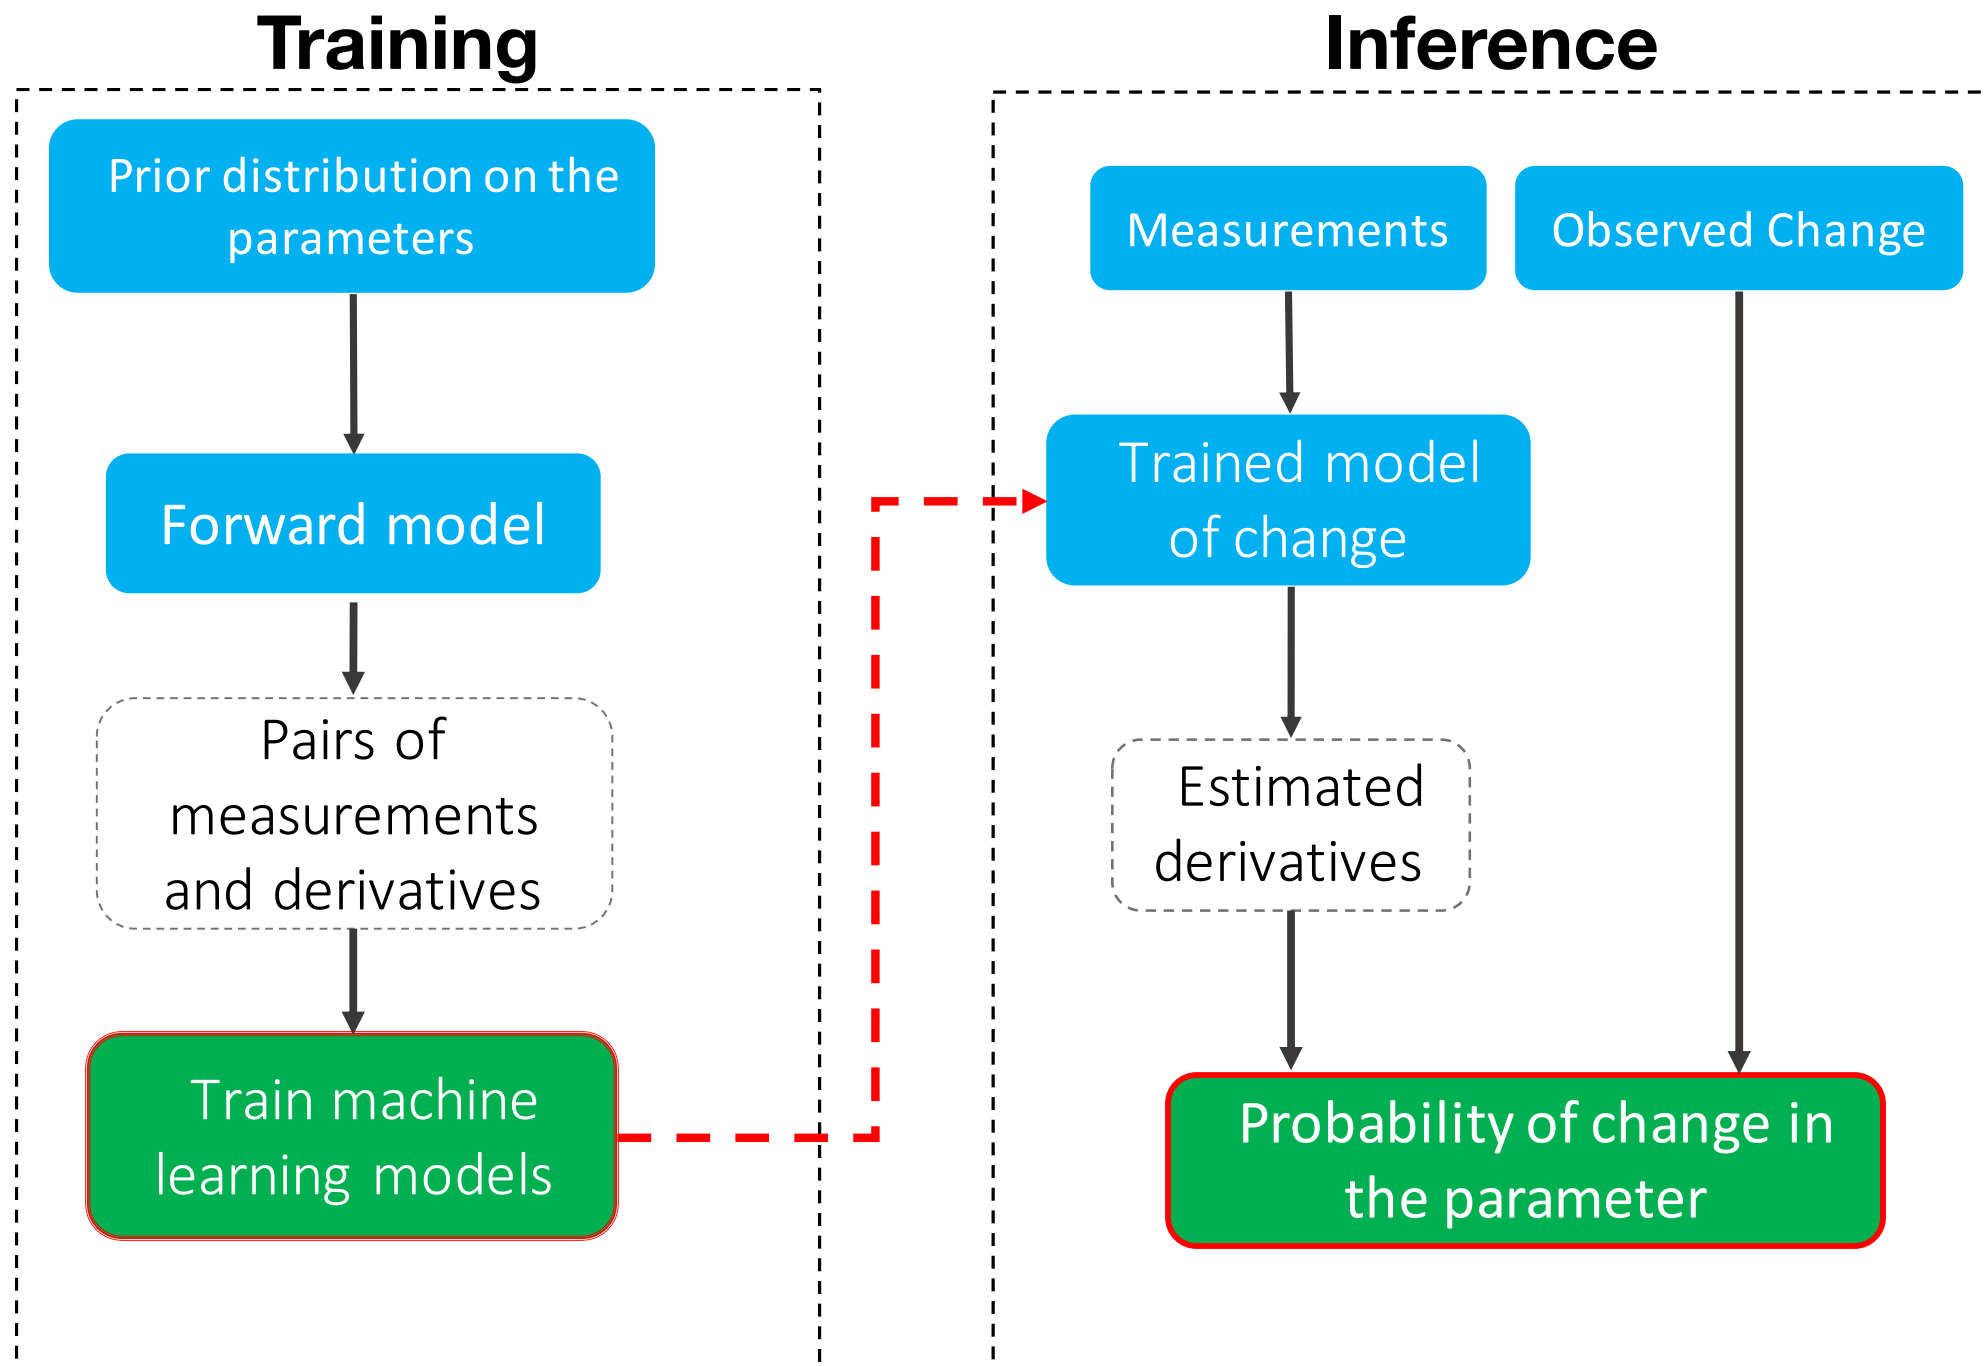

Which parameter has changed?

Change model

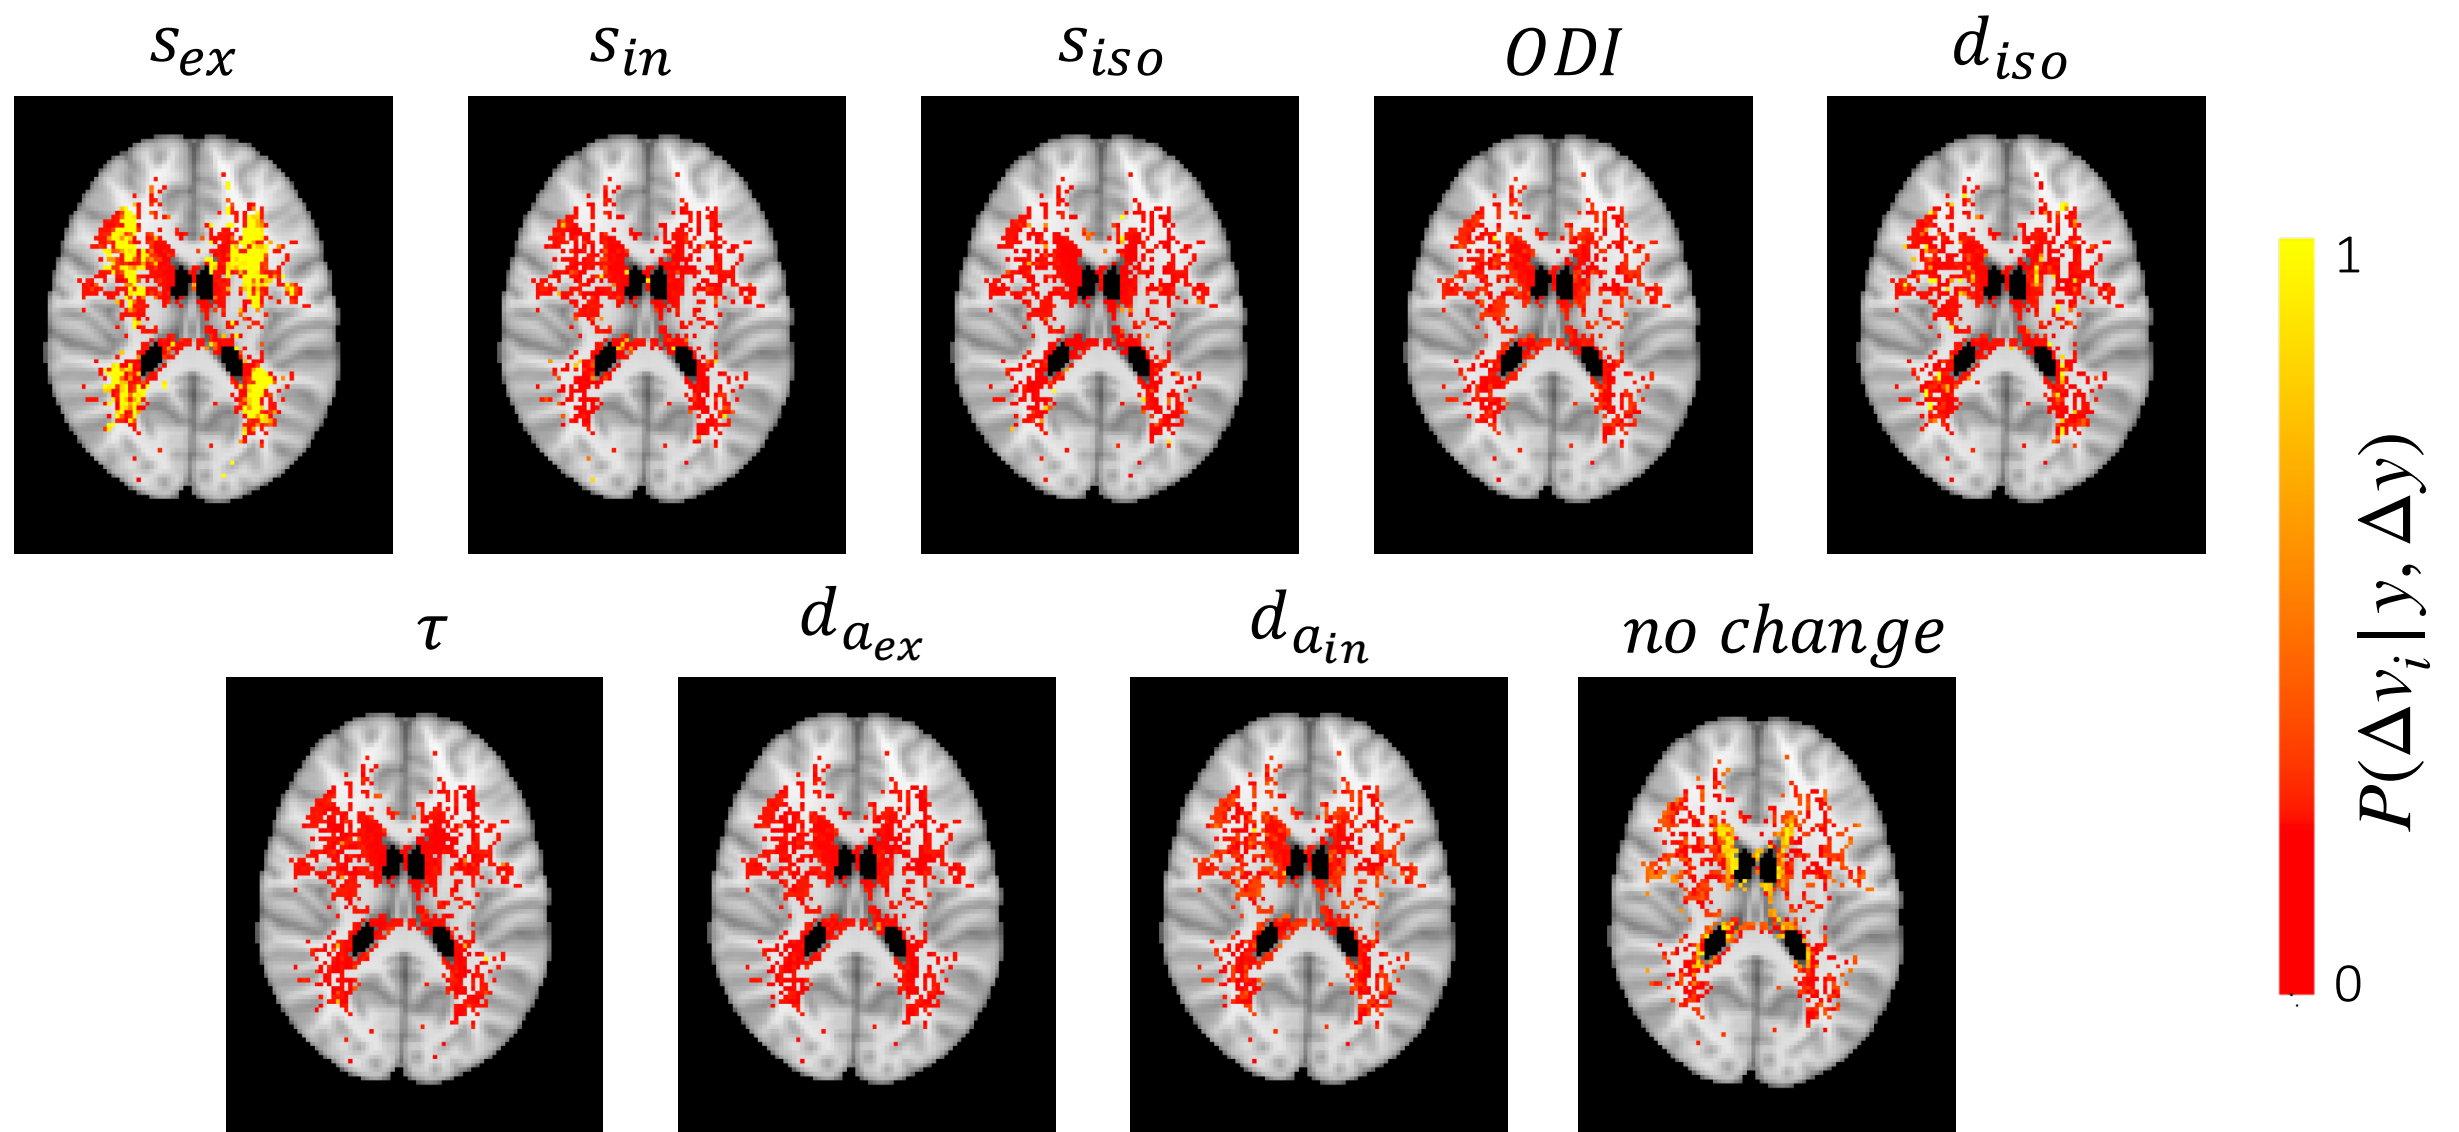

$$\frac{\partial y}{\partial v_i} \sim N(\mu(y), \Sigma(y))$$

BENCH Pipeline

BENCH applied to White matter hyperintensities

Posterior probability of change in each parameter

bioRxiv
THE PREPRINT SERVER FOR BIOLOGY

bioRxiv posts many COVID19-related papers. A reminder: they have not been formally peer-reviewed and should not guide health-related behavior or be reported in the press as conclusive.
